The process is rapid and gives very pure peptide quickly and using little equipment. The peptide can be used in veterinary medicine to synchronise ovulation in large animal herds, and in human medicine in the treatment of fertility disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LHRH; contraception; precocious puberty; endometriosis; breast tumours; prostate tumours; ectopic tumours; meno
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Luteinising hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthetic
                                                                                                                                                                                                                                                                                                    This luteinising hormone releasing hormone (LHRH) agonist has either a kecomethylene or dihydroketomethylene gp. replacing the amide linkage between residues 9 and 10 in LHRH. This results in an increase in oral activity. It is useful for eg male and female contraception, treatment of precocious puberty and endometriosis and treatment of breast—and prostate tumours.
                                                                                                                                                                                                                                                                                                                                                                                                      Orally active luteinising hormone-releasing hormone peptide analogues - have keto:methylene or hydroxy:ethylene in place amide between proline(9) and glycine(10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10-NOV-1987

A therapeutically effective amt. of such an antagonist is contained in a pharmaceutical compson. alongside a menopausal-symtom-alleviating amt. of a 19-nor progestational agent (II) (pref. both in single formulation). A pref. administered nasally in dosages of 0.01-1 mg/kg/ day for (II) and 0.02-0.07 mg/kg/day for (II). May be used for inhibition of ovulation, and treatment of eg endometriosis, breast cancer, polycistic ovarrian disease, or precocious puberty in female mammals.

if free of anaphylactoid side effects and is believed to be free of
endematogenic effects. The peptide may be used to treat precocious
puberty, hormone dependent tumours, e.g. malignant and benign
overstate tumours, e.g. secondary amenorrhoea, endometriosis and
covarian and mammary cystic diseases. The peptide is also useful
for regulating ovulation e.g. as precoital or postcoital
contraceptives, for synchronising oestrus in livestock and for
improving the "rhythm" method. It is also useful for regulating
the human menopausal gonadotropin, follicle stimulating and LH levels
the human menopausal and postmenopausal periods. As it suppresses
the spermatogenesis and testosterone levels in males, it may be of
cotential use for male contraception.

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte eptide or giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th)

0;

```
cc a heterogeneous population expressing diverse HLA phenotypes, and (B) cc an adjuvant peptide sequence from the invasin protein of Yersinia. cc spacer amino acid sequences (e.g. Gly-Gly) can be provided between the components in the hapten is LHRH, then optionally the invasin domain cc can be omitted from the immune stimulator and hapten cc attached to the stimulator to provide a potent vaccine for attached to the stimulator to provide a potent vaccine for cutering e.g. prostatic hyperplasia, androgen-dependent carcinoma, co cuterine tumours, recurrent functional ovarian cysts, (severe) cc induction of infertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to the resin via a photosensitive linker. The nonapeptide is from the resin by photolysis, the C-terminal is activated, an product is coupled with glycinamide to add the Gly-NH2. The decapeptide is then deprotected. In the decapeptide, Xaa is G gonadorelin; the present sequence), D-2-Nal or D-Trp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified-site
This sequence represents naturally occuring gonadotropin releasing hormone (GnRH). Analogues of GnRH are represented by AAR86846-56.

Motility disorders, including functional bowel disease, can be treated by the administration of one of the GnRH analogues shown here (e.g. by the administration of one of the GnRH analogue inhibiting leuprolide acetate). This is due to the GnRH analogue inhibiting production of reproductive hormones such as luteinising hormone, progesterone and relaxin. Motility disorders are caused from progesterone and relaxin attonomic nervous system. Due to this, the GnRH abnormalities of the autonomic nervous system.
                                                                                                                                                                                                                                                                           Treating motility disorders associated with systemic lupus erythematosus - by admin. of gonadotropin releasing hormon analogue, to control nausea, vomiting, abdominal pain etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-JUL-1995

The GORH analogues are administered by injection (which may be intavenous, subcutaneous or intramuscular), or by a drug delivery system. The drug delivery system can comprise a drug implant with timed release, a nasal spray or an injection of a long-lasting depo form. This method is used to alleviate symptoms such as nausea, vomiting, abdominal pain and altered bowel habits. The sequences can be used to treat motility disorders in a wide variety of other diseases including irritable bowel syndrome, diabetes, scleroderma and Parkinson's disease.

     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOCTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/447,175A
FILING DATE: 19-MAY-1995
CLASSIFICATION: 422
ATTORNEY/AGENT IMFORMATION:
NAME: RAUSCHENBACH, Kurt
REGISTRATION NUMBER: 40,137
REFERENCE/DOCKET NUMBER: SYP-114
TELECOMMUNICATION IMFORMATION:
TELEPHONE: (617) 248-7000
TELEFAX: (617) 248-7000
INFORMATION FOR SED ID NO: 6:
SEQUENCE CHARACTERISTICS:
LENGTH: 10 amino acids
TYPE: amino acids
TYPE: amino acids
TYPE: amino acids
TYPE: amino acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: peptide

the same biological activity the secretion of both luteinizing

and

f

```
A; Molecule type: protein
A; Residues: 1-10 < BUR>
A; Residues: the natural and synthetic hormones have the same biological activity
A; Note: the natural and synthetic hormones the secretion of both lutein
C; Comment: This hypothalamic hormone stimulates the secretion of both lutein
C; Superfamily: gonadoliberin
C; Keywords: amidated carboxyl end; hormone; hypothalamus; pyroglutamic acid
C; Keywords: amidated carboxyl end; doll #status experimental
F; 1/Modified site: pyrrolidone carboxyl end (Gly) #status experimental

gonadoliberin precursor - mouse
y,Alternate names: gonadotropin-releasing hormone (GnRH); luteinizing hormone
N;Contains: gonadoliberin; gonadoliberin-associated protein (GAP)
C;Species: Mus musculus (house mouse)
C;Date: 31-Dec-1993 #sequence_revision 18-Mar-1997 #text_change 18-Jun-1999
C;Accession: A47578
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A; Note: gonadoliberin stimulates pituitary secretion of lu A; Note: gonadoliberin-associated protein may have prolactin relea C; Superfamily: gonadoliberin (C; Keywords: amidated carboxyl end; hormone; hypothalamus; pyroglu F; 1-23/Domain: signal sequence #status predicted <SIG>F; 1-23/Domain: signal sequence #status predicted <GLB>F; 22-31/Product: gonadoliberin #status predicted GLB>F; 22-31/Product: gonadoliberin associated protein #status predict.
